Suspension Overview

A vehicles suspension is made up of three components, the tyre, the spring and the shock absorber. All three components need to be in good working order to keep the tyre properly in contact with the road.

The basic function of a shock absorber is to keep the vehicles tyres in contact with the road. The shock absorber regulates the movement of the spring and is the final crucial link in ensuring a smooth and more importantly safe ride. Even with new tyres and new brakes, unless all shock absorbers are in good working order vehicle safety is compromised because of reduced wheel contact with the road.
